Subject: Issue with TheIde

Hi all,

I do not know if am posting in the right topic but I have found something strange with the Theide since my last update (3250):

- Sometimes the submenu (ex Edit in main menu) are not working at all and I have to use keyboard shortcuts to reach "Replace", "Find" etc.. functions .

- The automatic code completion (I checked that it was enabled in "Setup/Environment" Assist tab) does not work. Only the access to U++ objects using :: is working but Assist++ does not start if I type a point (.) after my own object instance (ex myGrid declared in header file as a GridCtrl object) I have checked that GridCtrl package is included in my header file.

I have one other computer on which version 3211 is installed and the above problems do not appear at all .

I am working under Window XP pro (both computers) and compile my projects using MSC9 compiler.

If anybody has an idea?

Thanks for support

Regards
