Hi there!

I've just installed TheIDE from svn upp-mirror-read-only, compiled it with the old stable version of TheIDE and got a problem. Now I can't build anything. When I try to build something I got the following error: Invalid build method.

OS: Linux Ubuntu 11.04 64 bit

Hi Vand,

Welcome to the forum

Check that you have a file called GCC.bm in /home/<user>/.upp/theide and that it is readable. If the file is missing, you will most probably have one autogenerated in /usr/share/upp, so just copy it in the proper place. Also check that the build method in theide is set to GCC.

Best regards,
Honza

Thank you Honza
Yes, the build method was empty.
