View Forum Message <> Reply to Message

I am getting an error when I close my program that says warning memory leak detected.

This is in windows vista, when I close the program.

I only get it when I call a dll, that was written by Microsoft, which is winmm.dll.

From what I am reading on the web, they say it was designed that way, and it is not a bug.

I have included the program which is very simple along with the needed dll, and a sound file to play.

How can I capture this warning when closing the program and not have it displayed for a user of the program?

NOW HAPPY

Put MemoryIgnoreLeaksBegin()/MemoryIgnoreLeaksEnd() end around the call to the function that causes the leak. Alternatively, create an object of type MemoryIgnoreLeaksBlock, it will call these functions in constructor/destructor, thus affecting everything from its creation till the end of scope.

Best regards,
Honza

PS: Best solution would be of course to use non-leaking library

Thanks. I used the memoryIgnoreLeaksBegin()/MemoryIgnoreLeaksEnd() end around the call to the function, and that worked great.

While I would love to use one without the memory leak, it is actually a standard dll that Microsoft created and can be used to play a .wav file. It was pointed out to them about the memory leak, but their response was it was designed that way.

And I don't currently have the knowledge on how to de-compile their dll and then recode it not to have the memory leak, no how to code the functions that their dll provides.

Again thank you. It works great now.

And for others this has a working example of using a dll on windows. I couldn't get the example provided by U++ for doing dll function calls to work. But this simple code works great.

David

Hi David,
silverx wrote on Mon, 23 May 2011 20:56Thanks. I used the memoryIgnoreLeaksBegin()/MemoryIgnoreLeaksEnd() end around the call to the function, and that worked great.
You're welcome

silverx wrote on Mon, 23 May 2011 20:56While I would love to use one without the memory leak, it is actually a standard dll that Microsoft created and can be used to play a .wav file. It was pointed out to them about the memory leak, but their response was it was designed that way.

And I don't currently have the knowledge on how to de-compile their dll and then recode it not to have the memory leak, no how to code the functions that their dll provides. Well, what can you expect from M$... No need to decompile and fix their mess. You can try plugin/wav from bazaar, it has a metod PlayWav, which should work just fine for your purposes. It uses portaudio as a backend, so it is portable and platform independent.

silverx wrote on Mon, 23 May 2011 20:56And for others this has a working example of using a dll on windows. I couldn't get the example provided by U++ for doing dll function calls to work. But this simple code works great.
Anyway, wouldn't it be simpler to just #include <mmsystem.h> in your code and add winmm to the libraries in package organizer? But I'm no windows programmer, so if I'm talking nonsense here, just ignore it

Honza

PS: Forgot to mention that you can have a look at SoundExample from bazaar to see more options how to handle sound in U++. It also contains an example using the mentioned PlayWav function...

David

If I may, it is still a little bit weird. U++ only cares about leaks caused by calling new/delete. It is quite unlikely that winmm is using C++ new/delete inside its code.

OK, found the bug, you have wrong singnature of imported function, obviously winmm.dll knows nothing about U++ String type...

```
void t3::PlayIt()
{

 typedef int (*importFunction)(const char *, long);
```

With this change, no leaks, no issues, no need to ignore leaks.

I did look at the soundexample in bazaar, but when I try and execute it, I get all of the below messages which have a bunch of errors listed.

I also tried a few other examples from the bazaar area, but usually got a bunch of errors so I finally stopped going through the bazaar stuff. It would be nice if the bazaar items actually work like the examples.

I gave this a try, and it worked great.

Thank you.

I also tried a few other examples from the bazaar area, but usually got a bunch of errors so I finally stopped going through the bazaar stuff. It would be nice if the bazaar items actually work like the examples.
I am not a windows user, so supporting MSVC compiler and testing is bit harder for me. Also, bazaar provides code "as is", most of it works although as you noticed sometimes exceptions exist. Most of the problems is probably caused by insufficient testing, as in this case...

Anyway, I fixed the sound stuff to work with MSVC. I encountered some problems with WASAPI, so if you get some runtime errors, please try compiling it with "GUI .WMME" flags to use only WMME. If you are still interested of course

Yes, still interested in it.

How would I get a new copy of the fixed code, so I can try it again?

David

David
The easiest way is to just install newer version of U++, version 3455 (or newer). Or, if you are using svn, just update your working copy.

I did get the updated, and then tried it. It now works great.

Thank you for the fixes to the programs.

David
