Hello Koldo,

First of all I want to thank you for this great library.

I propose to add new method Value GetText(int col, int row) for Excel wrappers (MS and open). This method is same as GetValue but it returns the formatted text value.

The modified files are attached.

If somebody wants to generate word documents in base of excel data file and a Word layout template I attached the source code of this solution.

It can be uploaded in bazaar as demo of office automation.

Hello Ion

Do you mean that in case of a formula, GetValue() returns the formula and GetText() returns the result?
