Subject: Debugging - Wrong tooltip on mousehover

Hello,

while debugging in TheIDE a tooltip with value information appears if hover with the mouse over a token. But if we have the following tokens, it will show the wrong information. The first time "position" is a member of the class Object. "object" is a instance of Object. So if i hover over "object.position.x" it will show the values from position.x" This may confuse if the lines of code are not close together. (I always hover over the word position)

v1.x = p1.x - position.x;
v1.y = p1.y - position.y;
v2.x = p2.x - object.position.x;
v2.y = p2.y - object.position.y;

Using Build 3553 with MSC10
