I guess this question goes to Thomas . I found using brc files very handy and everything works flawlessly in 32 bit mode. In 64b mode visual c++ produces following error:
Shaders$brc.obj : fatal error LNK1112: module machine type 'X86' conflicts with target machine type 'x64'
Could that be fixed?

Well, I think Tom was trying to be too clever by converting binary files directly to .obj. I guess what we need there is to use C++ compiler to do so... (to create some const char[] = { files, then compile to .obj)

Mirek
Fantastic! Thank you.

Yesterday I moved back to using brc files in WinGl and I hit the wall with the maximum size of string array in visual c++ (interesting what's the purpose of this limit is). And today I see in the changelog that Thomas has fixed this. Thank you Thomas, now new brc system is perfect and I even had no time to complain about this on the forum
