I have a problem,I need guidance..
In the Parent layout, I have a master button and Master tab..Master tab controls Master tab..
Inside Master tab (as a content of master tab), there is a slave button and a slave tab.
So the slave button invokes the slave tab,both of these present inside master tab...
How to do this..I have done partial.. Stuck in invoking slave tab through Slave button...

Please help.

With regards,

Monty
