Subject: How to access sub window information in other functions?
Posted by silverx on Sun, 17 Jul 2011 10:43:41 GMT

In function, Subwindow1::OpenSubwindow() I great a second window, known as dlg2, using

```
WithTheSubWindow<TopWindow> dlg2;
CtrlLayoutOK(dlg2, "This is the subwindow");
```

Which opens fine. And I can access that window as dlg2 only in this function. How do I access things in that window in another function else where. Like I have a button that gets the size of the window. It calls another functions, but when I type in dlg2. I get nothing. I have tried all kinds of things, but nothing seems to get me to that window so I can change things on it like labels or get information from it.

How can I access this window from another function.

I have attached the complete code if that helps.

david

Use button "Generate code" in layout designer...

That works great. Thank you.

I tried it make it a separate class before with a separate .h file, but it had too many errors in it so I
went back to the way it is now.

Again this works.
