During a development of my project I encounter several bugs:

(Actually, this is not in Core) In Scribble Example a drawing is shifted if one scrolls the view.  
Tuples (has anyone using it?) comparison operators < and > were copy&pasted from != .  
RemoveSorted({1,2}, {0,3}) results in empty set

I had to fix them. Patches are attached.

Especially the third bug was very annoying for me. Because my project has already grown to impressive size and its nature is algorithmic, I have searched the bug several hours. Thanks to this very long debug session I was able to understand my code much better . Moreover, I found some minor bugs in my functions. Therefore, all in all, I was able to improve my project thanks to U++

Patches applied, thank you. (P.S.: svn compatible format would be better

What do you mean? The patches are generated by 'git format-patch'. To use them one may need add '-p1' option to 'patch' command.

I am using only git. I even track upp sources using git (git svn). Next time I will use '--no-prefix' option to 'git format-patch' and then the above problem should disappear.
