This is a very simple MDI example with text edit.
It's not finished, because it needs window arrangement functions, e.g. 'overlap', 'tile vertical','tile horizontal' , and it needs 'save/save as' functions.
I put it here in the hope of finding a better solution to MDI program.
Thanks

Hello o_wild

It is true that your app opens multiple windows but it is not really a MDI app as it requires the windows to reside under a single parent window.

Hi,Koldo
I found that Style() function in TopWindow can solve this problem.Modified code is attached.

Best regards
o_wild

Hello o_wild

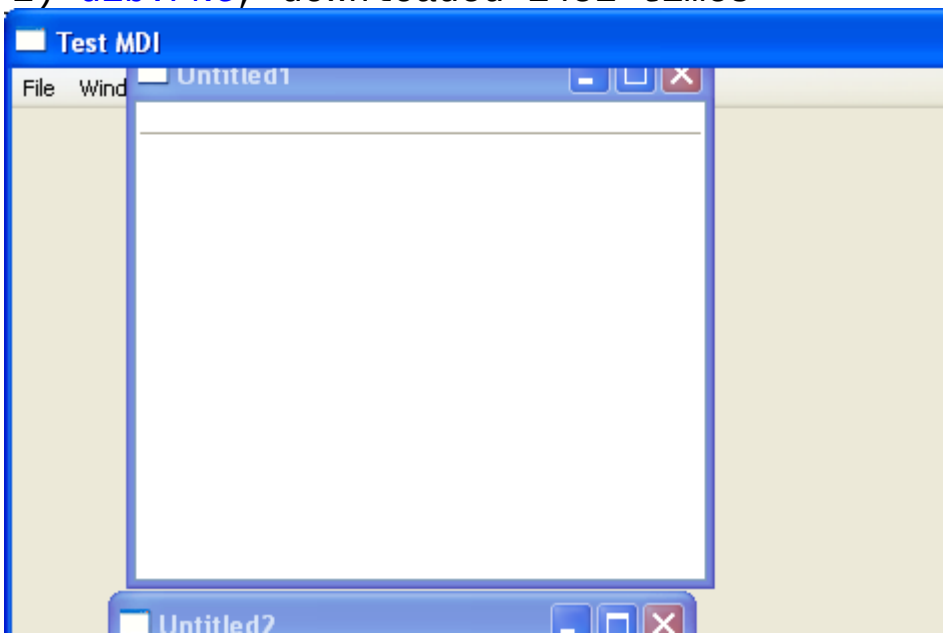

I see. Now it works rather well.

There is a little problem: the window overlaps the menu:

Do you think if it is possible to make it work in Linux?

Hi,
In Fedora the Style() function is not accessible in TopWindow class, and MaximizeBox().MinimizeBox() lose effect in child window.Sizeable() still takes effect.
By the way, installation in Fedora have a minor problem. 'make install' can not select /usr/local as the default installation path, and --prefix=xx is not accessible, so 'theide' is copied to the directory of the extracted source code(in my computer it is home/<myname>/Download/upp-x11-src-3550/uppsrc).

Best regards,
o_wild
