when i use some core function,
For example, `GetExeFilePath();`

so what can i do?

You could try to take a look at the package Core. It has a file called CharSet.h. This file has a bunch of UTF-8 related functions. You can start from `ToUnicode()` or `ToCharset()`.

Hello Akebee

When handling file names I use `FromSystemCharset()` to read file names into U++ String and `ToSystemCharset()` to set file names.

Got where? What means are you using to display this string and on what platform.

All filenames get converted to the encoding of your application, which by default is UTF-8. And if

you use GUI functions (like PromptOK), it should display correctly as well.

Things can be different for console.

Mirek
