Having rainbow more or less finished, let us compile the list of things that would be nice to have next:

- Google NaCl support in theide(IMO, this one would be big for U++)
- Google NaCl U++ backend
- Web development framework (something like Jango in U++ should be piece of cake..)
- Web development support in theide (html/js highlighting, some way how to export these to output directory)
- Android support in theide
- Android U++ backend
- MacOS X support in theide
- Gtk backend (more closely coupled, using Gtk eventloop)
- PdfPainter
- theide: Windows 64-bit debugging support
- theide look&feel improvements (docking, new icons...)

Feel free to add to the list. I will

Mirek

Nothing to add. It would be really great to have

- Web development framework

I used PHP and every time I imagined how it would be easier to perform the same task in U++. Even the web GUI would improve a lot with our lovely tool.

Thanks for all!

Luigi

Excellent task list.

I propose to include a kind of Docking for menu bars (if this is of interest).

Best wishes,

Javier

As menu is just regular Ctrl, I see no reason why it should not work with current Docking...

Well, the another issue is that there is a lot of work in the list. I can do it all, but it would take years:)

So another issue to discuss is perhaps delegating some of those tasks...

Personally, I would like to spend my time with web framework and perhaps with NaCl (which have some intersection).

Oh, I forgot:

- "U++ embedded" - improving FB rainbow backend and maybe theide too to make U++ a good embeded platform

Well, I'm thinking a bit more of a modular menu system for apps, and I guess Docking wouldn't be enough for it.

I think I'll drop some lines about it in some month... I need it anyways for my new app.

What I think would be great is a sort of xml-driven menu/toolbar system, with toolbars freely dockable on each corners of top window, and an user menu/toolbar editor embedded in applications.

Items could then send a String/Value/Number to listening handlers in applications.

That one would allow customization of menu system by end user, which is almost a must in cad applications (many, many commands and usually a small set that a user want to have handy).

Max

Well, if I understand you well, you ask for configurable menu and toolbar, correct? (Preferably by drag&drop).

This looks like only-code Todo.

I would keep in focus some other things as well:

- GSOC - another try
 - some production quality U++ application to become "famous"
 - some production quality complex examples for various different topics (MT events handling, client-server or P2P, etc...) (these would differ from simple examples in the way that they would solve everything including handling all error states, etc..)
-

Well, I guess Google might be quite interested in U++ supporting NaCl... more that those things in past we were suggesting.

In the ToDo list can be added:

- JavaScript V8 in U++
- TheIDE extensions using JavaScript V8
- event loop/event for windows (libuv) and for unix (libev).

<https://github.com/brimworks/libev>

<https://github.com/joyent/libuv>

Yes, That is a typical feature of CAD applications. To have it in TheIde would be superb!

Adding to list:

- Painter improvements:
 - ability to render to preexisting buffer
 - multithreaded rendering
 - maybe ability to use different final backend, or some other optimization here to improve performance on 16-bit displays - needed for embeded
-

Hello Mirek

I mean parent classes, main methods...

Actually, most likely single function would suffice, something like:

```
void RenderSVG(XmlParser& p, Painter& p);
```

concerning FB support:

i'm currently on the way to port upp to an ARM based embedded linux env. (angstrom), this could take some few weeks though.

another few things to add to list, if possible:

- further and proper extension of upp for python.
- ctrl's entire state persistancy (not only data).
- Value / Null handling to be more flexible concerning extension with some non-trivial, unmodifiable classes..(RichValue<LogPos> an example)..(ther's a thread on that already). handling of IsNumber(), IsFloat() types..

maybe this whole stuff from this thread should go to 'status & roadmap'

Definitely. But consider this as "preplanning" phase.

I would like putting a little bit more planning and organization to the development process. Of course, it will depend on people willing to contribute and to follow the plan(s)...

mirek wrote on Wed, 21 September 2011 10:11- on demand loading of some packages (U++ installation grew from 10MB to 30MB because it contains the whole bazaar).

A proposal for this one... and I could try to implement it with some help :

- 1) Bazaar svn repository on GitHub (or elsewhere)
- 2) A "metarepository", for example named Modules, which contains just the module list updated, maybe automatically
- 3) A menu entry in Theide which downloads point 2 and offer the choice of getting optional modules with svn (and update them on demand)

We could have even 2-3 repositories, the classic Bazaar, one for testing code before putting to Bazaar and one for most tested code, which will probably go into Upp.

Ciao

Max
