Hi everybody,

I wished to add `WM_PING` / `WM_PID` support for U++ topwindows.

I am successfull with `WM_PING` I guess - if I 'freeze' the window, pressing close button indeed invokes termination dialog after a while.

Unfortunately, saying yes in this dialog closes the window, but does not kill the process, which obviously is not right...

I have already spent about 8 hours trying everything to no success. I guess I need external fresh view of the issue. Any ideas?

(The relevant code is in `CtrlCore/TopWinX11.cpp`, search for `WM_PING` and `WM_PID`)

Mirek

P.S.: I am using `uptpst/freeze` as testing app...

Hi Mirek,

I tested on Xfce 4.8.2, U++ revision 3869, compiled with GCC and Clang in Debug mode. It works as expected for me. The frozen application is correctly terminated by KILL signal after clicking on yes in the "do you want to kill the unresponding window" dialog... The error might be in the desktop environment/window manager you use, not in U++

Best regards,
Honza
