---

Hello,

I am trying to perform the updtate of a record where the fields are retrived from a GridCtrl named masterTeam. This is what I am doing with a function that performs both the update if the ID is already in the table and the insertion in the opposite case

```
void VegaTab1::SaveMasterRecord()
{ int ndx = masterTeam.GetCurrentRow();
  if (ndx<0) return;
  int id=masterTeam(ID); // <-- make sense?
  Select(SqlAll()).From(TEAMS).Where(ID == masterTeam(ID));
  if (SQL.Fetch()) { // record already present
    SQL.Execute("UPDATE TEAMS SET N=1, NAME='?', ORIG='?', FED='?', RTG=?, STATUS=? WHERE ID=?",
               masterTeam(ndx,NAME), masterTeam(ndx,ORIG), masterTeam(ndx,FED),
               masterTeam(ndx,RTG), masterTeam(ndx,STATUS), id);
  }
  else { // new record
    SQL.Execute("INSERT INTO TEAMS (N, NAME,ORIG,FED,RTG,STATUS)
VALUES(?, ?, ?, ?, ?, ?)",
               1, masterTeam(ndx,NAME), masterTeam(ndx,ORIG), masterTeam(ndx,FED),
               masterTeam(ndx,RTG), masterTeam(ndx,STATUS));
  }
}
```

the table is

```
TABLE_(TEAMS)
INT_ (ID) PRIMARY_KEY AUTO_INCREMENT
INT_ (N)
STRING_ (NAME, 30)
STRING_ (ORIG, 30)
STRING_ (FED, 30)
INT_ (RTG)
INT_ (STATUS)
END_TABLE
```

Unfortunatly it performs always insertion and never the updtate.  
Where is the mistake?

EDIT: this works:

```
void VegaTab1::SaveMasterRecord()
{ int ndx = masterTeam.GetCurrentRow();
if (ndx<0) return;
 int id=masterTeam(ID);
 SQL.Execute("SELECT * FROM TEAMS WHERE ID=?", id);
if (SQL.Fetch()) {
    SQL * ::Update(TEAMS) (NAME, masterTeam.Get(ndx,1))
        (ORIG, masterTeam.Get(ndx,2))
        (FED, masterTeam.Get(ndx,3))
        (RTG, masterTeam.Get(ndx,4))
        (STATUS, masterTeam.Get(ndx,5))
        .Where(ID == id);
}
else {
    SQL * ::Insert(TEAMS)(N, 1)
        (NAME, masterTeam.Get(ndx,2))
        (ORIG, masterTeam.Get(ndx,3))
        (FED, masterTeam.Get(ndx,4))
        (RTG, masterTeam.Get(ndx,5))
        (STATUS, masterTeam.Get(ndx,6));
}
```
