http://en.wikipedia.org/wiki/Raspberry_Pi

Are you getting one?

I do. I believe that it will be 'ultimate' low-power/low-performace platform to play with

(but then we have started developing U++ when 200Mhz Pentium I was standard target platform for U++ apps. 700Mhz ARM should be just fine for running theide. And BLITZ can possibly make compilation bearable

---

Hello Mirek

How did you make the order?

I wanted to do a very low cost security system with camera and modem for my mom (and later for me).

koldo wrote on Mon, 07 November 2011 15:37Hello Mirek

How did you make the order?

It should be first available in December...

Subject: Re: Raspberry Pi
Posted by mr_ped on Tue, 08 Nov 2011 08:33:42 GMT

I'm looking on it as well, not sure what I would do with one, but $35 sounds right to me. Actually

it's crazy, considering the computing power of that board. (700MHz RISC processor and OGL chip if I understand the specs correctly)

Let me know for sure if you get one finally and how does it work. (maybe time for another Prague live session to see U++ running on it)

Ops, now I see this could be interpreted two ways. I meant sooner date for 'live session'. I do not

expect Pi to available sooner than next year...

It looks nice... the B Model would be able to be a real effective home server (maybe with a kind of asterisk?).

Do you know if it will be avaiable in germany? I'm REALLY interessted..

Why do you need it to be available in Germany? I guess they will be shipping worldwide...

If they do I don't need it extra avaible in germany... but then they dont ship worldwide it would be nice to be able to get one.

Quite attractive at that price, although shipping costs may well make it less attractive. Thanks for the pointer. I remember that the name didn't catch my attention when I read it some time ago while browsing the ReactOS forums. On the other hand, it is only a naked board and you'd probably get similar hardware if you bought one of these ultra-low-cost laptops on eBay (prices vary depending on screen size (7 to 10.2 inch) and processor speed (266 to 800 MHz) between around 75 and 125 USD including shipping), which appear to be around since late 2009.

There is some interesting hardware around that should be capable of decently running graphical applications at a cost lower than what you'd pay for an ordinary computer. As you say 200 MHz processors used to be a target for U++ applications, I wonder whether it would be possible to get U++ applications running on independently developed hardware, driven for instance by modern

microcontrollers like the upcoming version of the Parallax Propeller, perhaps also without any or with a custom operating system (could Rainbow be used for that?). I for one would very welcome U++ support for embedded targets.

Yes. I am quite aware about it, but I guess the difference this time is in software support. IMO it is much better to have it running some latest Linux SW out of hand than spending time jailbreaking and installing something.

Also, for real fun, using ordinary LCD display with reasonable resolution and normal keyboard/mice is better...

We have Ultimate++ running on Gumstix, Freescale i.MX53 (loco), and the Pandaboard, including full native IDE compilation on the arm platform itself (no cross-compilation required). Native compilation can only be done on the Gumstix with 512MB of memory since the linking stage of IDE build and application build takes lots of memory. Native compiles are somewhat slow on these arm platforms but are considerably sped up if a SATA drive is used to host the operating system. (SATA support is available directly on the Freescale and is available with a USB to SATA adapter on the other platforms). We have several active programs using arm-based Ultimate++ executables running critical embedded apps and more are coming all the time. Unfortunately, the details of most of the apps are ITAR controlled but we are willing to share some basic configuration details and examples if people are interested...

Hi,

For those looking for small boards, there is also alix boards

Somebody gives his first impressions here.

I never had the opportunity to use that myself, but a friend of mine uses 2 under Linux Voyage : one as firewall and another as IPBX with Asterisk. According to him, it's a very cheap and good solution !

Subject: Re: Raspberry Pi
Posted by Wolfgang on Wed, 22 Feb 2012 08:52:08 GMT
View Forum Message <> Reply to Message

but the prices are about 145 EUR (just tried on ebay) - this isn't really "cheap" if you take a look on the raspberry project.

Subject: Re: Raspberry Pi

Hello Scott,

I will be using U++ on an ARM board shortly along with LCD screen and touchpad, not quite sure which model of board yet (Rasberry-PI availability isn't good enough for the moment).

So if you have a config examples, UPP modifications It would save me a bunch of time !!!

Thanking you in advance

Subject: Re: Raspberry Pi

View Forum Message <> Reply to Message

The boards I'm actually targeting for the moment are the following:

 http://friendlyarm.net/products/mini2440
 http://friendlyarm.net/products/tiny210
 https://www.gumstix.com/store/product_info.php?products_id=2 64
 https://www.gumstix.com/store/product_info.php?products_id=2 11
 http://www.variscite.com/products/item/32-var-som-am35
 RasberryPI ????? when really available

If some of you have some experience with these boards or at least the quality of their linux packed
with the boards the info would help me in making my final choice.

Hello Wolfgang

Yes, now it does not work, but some hours before it worked.

It is strange: almost no info, some pictures of a card similar to Raspberri Pi and some screen views similar to a tablet (is it a card or a tablet?)-

Wow, the 49$ thing looks nice!

But is Android the only OS planned?

Subject: Re: Raspberry Pi
Posted by Wolfgang on Thu, 31 May 2012 19:40:47 GMT

Just ordered....
Quote:Description Qty. Units Unit Price Goods Value
Raspberry Pi Type B Single Board Computer

Micro USB Euro power supply for Raspberry Pi

Offers will be applied to your invoice

I can hardly wait...

Subject: Re: Raspberry Pi
Posted by jerson on Fri, 01 Jun 2012 09:34:29 GMT

FWIW. I got this just today.

Quote:Message: 18
Date: Thu, 31 May 2012 11:46:00 -0400
From: John Ferrell <jferrell13@triad.rr.com>
Subject: Re: [OT] Element14 and Raspberry Pi update.
To: "Microcontroller discussion list - Public." <piclist@mit.edu>
Message-ID: <4FC79238.2070303@triad.rr.com>
Content-Type: text/plain; charset=windows-1252; format=flowed

My number came up.
I ordered it with most of the options, just to rule out any unnecessary
misadventures.
I have no idea what to do with it.
Strange that the Linux Fedora on a SD card is on back-order, hopefully
that will change before the promised 6-week delay to ship is reached.
It does not matter though, I have no use for the product with out the
software. It does seem strange that they don't simply post an ISO and
instructions.
<<Unless, of course, it really don't work as promised>>

If it turns out to be a hoax or other misadventure, it won't be my first
time on that trip!
I don't plan on investing much more time until I receive the product...
They must have about a half million dollars in orders accepted now.

Looks good. Definitely better than the beagle Board, same price tag though.

The main and almost only attracting point of the rpi is its price for hardware ratio. The hardware by itself is more or less dead.
Currently no one offers so much for so little money.
Beagle Bone might be a comparable byt 3 times the price.
What about the goose berry?

[EDIT]
for my current home project (home automation with sensors, actors, interfaces, based on canopen, OSC, android, U++) the beaglebone will be the way to go. it is well equipped and sufficiently affordable. the raspberry isn't it, quite..
it'l be sorta
http://ninjablocks.com/
but less fancy and more functional

If anyone interested in emulating Raspberry PI on i386 and get their software development going
without getting into GPIO programming can use QEMU to do just that. here is a tutorial how to
emulate raspberry pi on Linux and Windows.

QEMU Emulating Raspberry Pi the easy way (Linux or Windows!)
 http://xecdesign.com/qemu-emulating-raspberry-pi-the-easy-wa y/

QEMU Compiling for ARM (1176) emulation for Linux
http://xecdesign.com/compiling-qemu

raspbian image:
http://www.raspberrypi.org/downloads

I have tried and doing it for a hobby project for someone at this moment. I got the wheezy-raspbian happily emulating on QEMU on a Linux Mint on my laptop. At this moment I am working to create a GUI with Tkinter+Python to process and display some real-time data. On real raspberry system these data will be coming in via GPIO pins from a car engine. Also will be looking into a way to see if u++ can be use to do the GUI, though interacting with GPIO will be a challenge along with cross compiler going as discussed on this thread. Thus at this point only concentrating on ready made setup (Tkinter+Python).

p.s. if you want to run QEMU on an OS inside VirtualBox, make sure you have mouse integration disabled on VirtualBox. Or else QEMU can't get the mouse working properly.

Regards,
navi
