

I was hoping I could get some debug insight into a problem I have currently.

We use a DropList, which we populate with about 10 or so items using the `droplist.Add(int, String)` syntax. I've added a menu option that will call

```
droplist.ClearList();  
droplist.Clear();  
droplist.Add(5, "item 1");  
... more Adds to re-populate list.
```

Initially, this works, `ClearList()/Clear()` appear ok on an empty Widget. But the second time it will core dump.

If I take out the `ClearList()` and `Clear()` calls, it works fine, except of course the DropList item now has duplicated (doubling each time I use the menu option).

I tried to reproduce this in Converter example, but I was unable to make it crash, so I assume it is something silly in my code.

The coredump traceback is rather deep, apologies:

From the stacktrace it looks like some very specific case.

Would you mind posting the whole package here?

The project has become somewhat large now, but its all in CVS if you really are keen.

I can add more curiosities.

When the Droplist is loaded, I set it to the value it was selected as last time (saved on disk) using plain "=" overloaded.

If I do not touch the Droplist, it works. Including refreshing multiple times.

If I open the droplist, and select something, including the item already selected, then refreshing will core as shown.

But no amount of trying to Focus on something else will stop it from crashing once I have picked something.

Actually, are not you doing those ClearList and Clear from inside of DropList WhenAction?

Nope, nothing so unusual.. No .When* used at all.

grep sitelist will show only calls to:

ClearList
Clear
Add
GetCount
GetValue
GetKey

Well, this is not enough info to get it resolved....

Would it at least be possible to post UExp and Trans classes related files (.h + .cpp)?

Just zip them and post here...

```
cvs -d ":pserver:anoncvs@lundman.net:/home/cvsroot" login
"anoncvs"
```

```
cvs -d ":pserver:anoncvs@lundman.net:/home/cvsroot" co UExp
```

However, debugging by commenting crap out, I have tracked it down.

If in my reply to SITELIST, I simply Droplist.Add() it works, ie, commenting out my dreadful attempt to sort the Droplist.

If I put this code in, it will die:

```
if (data.Has("END")) {
    // Sort list, then populate gui
    // Create a map between names and siteid
    VectorMap <String,int> namelist;
    Dict *tmp;

    for (int i=0; i < sitelist.GetCount(); i++) {
        tmp = &sitelist[i];
        namelist.Add(tmp->Get("NAME"), atoi(tmp->Get("SITEID")));
    }

    // Sort said map based on name
    Vector<int> o = GetSortOrder(namelist.GetKeys());

    // Look up name/id based on sorted order. This could use "namelist" ins\
thead
```

```
// of sitelist though.  
for(int i = 0; i < o.GetCount(); i++)  
    gui->do_SiteAdd(atoi(sitelist[o[i]].Get("SITEID")), sitelist[o[i]].\br/>Get("NAME"));  
  
    // Tell GUI the end is reached.  
    gui->do_SiteAdd(-1, "");  
    return;  
}
```

Most likely because the Strings given are on the local stack.

Accidentally, I think I have found it - when fixing completely unrelated stuff. At least the stack
backtrace looks almost the same.

To fix it, add

top = NULL

at the end of WndDestroy functions (around line 382 of CtrlCore/X11Wnd.cpp) (before ending
brace).

(Fix will be in the next release too).

That works beautifully. Thanks.
