SqlCtrls is now able (using Table method or its operator() synonym) to automatically map widgets to DB columns based on layout and db-schema introspection - columns and widgets are matched by names, case insensitive, Buttons and Labels excluded.

There is now also a new reference example:

http://www.ultimatepp.org/reference$SqlCtrls$en-us.html

demonstrating both "manual" method and new automatic matching, based on main config flag.

Great Job!

This feature will simplify even more making dialogs to fill Db fields.

With all the work done around sql REFERENCES & automatic join Db management becomes so easy

Hello all,

I submit here another sample project based on the original project SqlCtrl.
