SqlMassInsert now got a SqlBool to EndRow, useful in scenario when the operation is "replace" - replacing many rows in database.

SqlMassInsert then combines all these SqlBools and issues a single 'delete from TABLE' before inserting new rows (by combined insert .. select union commands). All commands for group flush are combined into transaction and there is also a new IsError flag.

Example:

```
SqlMassInsert ins;
```

```
...
```

```
for(...) {
```

```
    ins
```

```
        (DAY, day)
```

```
        (KEYWORD, keyword)
```

```
        (SERVICE, service)
```

```
        .EndRow(DAY == day && KEYWORD == keyword && SERVICE == service);
```

```
    if(ins.IsError())
```

```
        throw "SQL error!";
```

```
}
```
