Subject: [Solved]JSON question

Hey,

My application receives an JSON response from server and I need to iterate through it. Every "x" response contains different keys and I cannot figure out how to read them.

Lets say I receive the following response:
{"type":"work","state":"NY","language":"en")}

How can I list all the keys (type,state,language)? Any clues would be appreciated.

Thanks.

Just got it sorted with ValueMap, didn't noted it before
