When I insert from file certain images the .iml file is suddely empty. I attached one of these. For now I use copy and paste as a workaround, but that means redoing the transparancy.

I am afraid I was not successfull reproducing this. I have inserted provided .png without problems.

Could you please provide more detailed 'walkthrough' leading to the bug? Eventually with .iml file affected...

Mirek

Hi Mirek.
I do it like this: (and it works every time)

1)
Create a new package "testpackage", type Ctrlib application with main window. I tick the box Imagelist file, and clear the box "Use SSE". Everyting else is default. Now create the package.

2)Select testpackage.iml, and choose 'Insert from files(s)' from the context menu and choose the

image I supplied earlier. I shows ok.

3)Select another tab, for example "testpackage.lay" and then again select testpackage.iml. There are no images anymore. Ones that were added earlier have now also disappeared.

My System is Windows Xp service pack 3.
I use TheIDe build 4193 and MsVisual C++ 2010 Express.

I added a zip file to this post.
It contains:
* 2 iml files:
1.iml has a .gif of a plant added to it.
2.iml is the same iml after inserting the insulting image.
* a folder with the project, the plant image and the red table

Thanks, in the end it was 'caused' by filename starting with digit, which resulted in invalid id of Image, which could not been reloaded later.

Now fixed.

So, how do you reference an image from a file starting with a number? (Not that I would now that I know)

You do not. Just rename the Image.

The fix involves adding '_' before the name of image in this case..
