Hi,

finally the new GDB frontend inside ide became usable... still many features to add, but it can already do a bit more (and also a bit less ) than previous one.

To test it, just compile theide from sources or fetch a nightly build (it should become available in a few days from today 2/2/2012); in settings menu you can choose from standard GDB frontend or the new Gdb\_MI2 one.

Added features :

- variables explorer (similar to windows PDB one)
- decoding of Upp classes, work in progress, by now just string and vectors, but easy to extend with python

Missing features :

- Quick watch (really never found use of it, but....
- Still some quirks with disasm pane
- CPU registry not set

To do :

- Threading support
- Watchpoints

Please, feedback !

Ciao

Max

The GDB\_MI2 frontend is almost complete now.

Features :

- Deep QuickWatching : the quickwatch dialog evaluates variable childs at once

- Threading support

- Decoding of Upp containers and types; by now it decodes String, Vector, Array, Index, VectorMap and ArrayMap, One and Value for standard and rich types
- Variable explorer, as in Windows debugger
- Tooltips in editow showing variables values when debugging
- Support for 64 bit CPU registers in 64 bit mode
- Fast !

To select the new frontend, go to Ide settings menu and select the Gdb\_MI2 one.

Ciao

Looks good.

Somehow I am not successful with assembly level debugging. It does not show pointer to current opcode and it does not allow stepping in assembly (normal source code step is performed).

AMD64 has more registers than those displayed. Plus, showing FPU registers would be nice too. I therefore believe that we rather need a new pane for registers....

Ops... I forgot that one  
I'll fix it on next couple of days.

Eh.... AMD64 has tons of registers, but we'd need a complete pane for it. I was thinking on it, but then you'll lose the quick-look at principal registers that is available now, if you use another tabbed control to alternate between assembly and registers.  
If you have a nice idea about the layout I can implement it.

Another nice feature I'd like to add are a sort of Tracepoints; breakpoints that, instead of stopping target, evaluate and log an expression when passing on them.  
Hardware breakpoints could also be possible.

BTW, for both of latter points, it would be nice to have different breakpoint symbols on theide and a right-click menu on them, to configure them on the fly.

No, I meant put it where "Local", "Auto" etc are... Just add "CPU".

(I plan to do this for pdb when I will finally get there).

ah, ok... that can be easy done.

Which registers do you want to be displayed ? All is too much, I guess.....

Another one: Displaying type of expression is fine, but it would be good to add a special column for this. Plus, I think EvenOdd would look better for that ArrayCtrl (will be more important then too).

mdelfede wrote on Mon, 06 February 2012 11:41ah, ok... that can be easy done.

Which registers do you want to be displayed ? All is too much, I guess.....

16 integer, 16 FPU/YMM, FS, GS would IMO cover all important.

I guess you will need to figure out some smarter design than simple ArrayCtrl for this.

I even think that for integer registers, there could still be space to display even integer values and characters (unicode).

16 integer, 16 FPU/YMM, FS, GS would IMO cover all important.

Correction: forget about YMM, that is too much. Just FPU values.

What is EvenOdd ????

EvenOdd colorizes Even rows - see e.g. Output mode in theide.

I added an "Asynchronous break" command, which allows breaking target application on demand without need of a previously breakpoint set.  
For example, if you have this endless loop:

```
int i = 0;
while(true)
{
    Cerr() << i;
    i++;
}
```

you can use "Asynchronous break" to stop in the middle of it; it'll usually stop inside assembly code, but then with a "step" command you'll land on first available source line.  
This work even if you don't know where's your app hanging.

By now, the command will stop ALL your app's threads at once.

Ciao

Hello Massimo

Thank you for your efforts in GDB .

Added pretty printers for :

Point (and Pointf)  
Size (and Sizef)  
Rect (and Rectf)

BTW, my python skills are quite limited, if anybody want do jump in and clean my python code is very wellcome....

Some enhancements :

- Values now are inspectable.... well, they will be when a patch will be embedded in core. No more crash when trying to inspect an uninitialized Value.
- When stopping inside a callback, now X11 grab is correctly released, allowing normal mouse and keyboard usage

- Ctrl-Q now opens QuickWatch pane getting the variable from cursor, either in code editor or in one of watch panes below.

- Some others that I forgot

Ciao

Value inspectors completed, with Core support.  
Now all Values convertible to String are correctly displayed in debugger.
