I have a project where my code have to create and write a DBF file with memo fields (DBT files) for a legacy application.

Is there a way in U++ to do this, or I have to use some other library?

Check out: http://sourceforge.net/projects/xdb
It's quite old but I have been using it, a few years ago, and it worked really good.

Thanks, seems to be useful. The only problem that I did't mention before is the license (LGPL). I have to create a statically linked exe, so a BSD like license would be appropriate.

plugin/dbf seem to support memo reading, unfortunately, it seems like write is not there...

Yes, write is missing. I did not start the work yet, but it seems, I have to implement this somehow.

I found a doc here.
