I created an application on U++ on the order of one Moscow company. This is a discount kiosk 2.5 meters in height with a touchscreen, running on a processor Atom.

The biggest challenge was to make on such a processor, a continuous HD video at the top of screen and at bottom the discount coupon kiosk interface.

To view the video package has been developed called VLCplayer (see in the bazaar). In which were used Koldo ideas, but greatly improved performance by rewriting from 0 and discard all the excess.

To display map of shopping center Anton(sc0rch) made package MapRender (see in the bazaar). Print coupon checks used my generator based on the reporting forms QTF templates RepGen (see in the bazaar). In addition, developed back-office systems and automated synchronization of content-based ssh.

More screens

To draw the interface had to be closely acquainted with the nuances of Chameleon Technology.

Very good looking.

When I see this, I can't help thinking that chameleon doesn't get the publicity it should !

A very good example of it should be done. I mean one that gives a very good look to a small app not just coloring buttons

Which tabs did you use ?

I used a modified TabCtrl, where bookmarks are made of the same width.

It turned out not a generic class. Because I could not find entry points for the chameleon TabCtrl, to make the all-clear. This class turned out tied to global structures of a particular application.

OK Thank's,

Ill take a look at the TabCtrl equivalent you made

I agree

Could any expert do a simple cute modern look sample of chameleon .

Design, of course, not mine. The customer ordered an interface to the designer.
I made only on the implementation on the U++.
