The function returns an uninitialized string if OpenProcess or EnumProcessModules return an error.

Perhaps a better way:

```
String GetProcessName(long processID)
{
    WCHAR szProcessName[MAX_PATH];
    String r="";

    // Get a handle to the process.
    HANDLE hProcess = OpenProcess(PROCESS_QUERY_INFORMATION |
    PROCESS_VM_READ, FALSE, processID);

    // Get the process name.
    if (hProcess != NULL) {
        HMODULE hMod;
        DWORD cbNeeded;

        if (EnumProcessModules(hProcess, &hMod, sizeof(hMod), &cbNeeded))
        {
            GetModuleBaseNameW(hProcess, hMod, szProcessName,
            sizeof(szProcessName)/sizeof(WCHAR));
            r=FromSystemCharset(WString(szProcessName).ToString());
        }

    }

    CloseHandle(hProcess);
    return r;
}
```
