Subject: Debugging XML files

Hello Mirek

It would be great if it would be possible to debug XML (and probably JSON) strings with problems.

Now LoadFromXML() rejects the error messages by doing a catch(XmlError) {}. Perhaps they could be saved in a log file.

Sometimes the error messages could be better. For example in Value.cpp and other files, "invalid Value type" messages could include the invalid type, for example doing throw XmlError(Format("invalid Value type '%s'", name));.

And it would be great if the error message could include xml String line or char number where the problem appears. This way it would be easier to debug the problem.

Thank you!
