Hello all

RegisterSystemHotKey() permits to call a function when pushing a key while the program is running.

The problem is that this is system wide so, if the program has got for example the F5, Firefox will not update using F5.

Do you know if there is some similar function but valid only if your program window is on top?

Hi koldo:

Interesting question. I don't have an answer but you should be able to find it easily. I assume there is a mechanism in EventLoop or similar things to dispatch keyboard event to appropriate Ctrl's, you may examine code in that part to see if an opportunity has been offered (eg, by way of Callback) to library user to intercept the keyboard event. If not, you can do a little hack there

Hi koldo:

I examined some relevant upp source, chance is there is no such facilities provided currently.

eg, for Win32

\$(uppsrc)/CtrlCore/Win32Wnd.cpp

```
void Ctrl::sProcessMSG(MSG& msg)
{
    if (msg.message == WM_HOTKEY) {
        if(msg.wParam >= 0 && (int)msg.wParam < Ctrl::hotkey.GetCount())
            Ctrl::hotkey[(int)msg.wParam]();
        return;
    }
}
```

```
}  
if(msg.message != WM_SYSKEYDOWN && msg.message != WM_SYSKEYUP  
|| PassWindowsKey((dword)msg.wParam) || msg.wParam == VK_MENU) //17.11 Mirek - fix to  
get windows menu invoked on Alt+Space  
    TranslateMessage(&msg); // 04/09/07: TRC fix to make barcode reader going better  
  
    // Code can be inserted here to add the required facility IMHO  
  
if(IsWindowUnicode(msg.hwnd))  
    DispatchMessageW(&msg);  
else  
    DispatchMessage(&msg);  
}
```

Hi Koldo,

Why so complicated? I think that the functionality you want can be achieved simply by overriding Key() method in your main class, am I right? If the focused Ctrl doesn't accept the key, the event "bubbles" up the ctrl tree, until it reaches the main class, which would handle it the way you want.

Are we talking about GUI app? Or is there something I'm missing?

Best regards,
Honza

Thank you Honza

It is as simple as that.

Thank you too Lance .

Simple, smart and it should work in most situations and in particular it works in your situation.

That is true and obvious, but there is one more usage scenario not covered (or not easily): this works only for single top-level window.

Anyway, you can also InstallKeyHook, which is application-wide.

Very interesting. And there are:

- MouseHook
 - KeyHook
 - StateHook
-
