Subject: PROPOSAL: seperate backend from frontend

the data of a tree-ctrl can be used also in console-apps, but unfortunately it isn't a container. would be nice if serialization to and from a seperate tree-container class would be possible, maybe with TreeCtrl::Nodes being derived class of the container's equivalent to allow pick-construction of the continer...

and maybe users will find other front-ends to tree-containers, maybe actually displaying as trees/graphs. on the other hand maybe a derived class could extend trees into planar graphs and then such a seperation might turn out to be fatal. however, it definitely doesn't hurt to copy some members of treectrl into a container-class and implement some copying and picking.
