I just started throwing some programs together with U++ (just downloaded the latest stable release today), and am running into the following compiler errors from TheIDE:

```
C:\MyApps\TestServer\main.cpp:13:2: error: 'Socket' does not name a type
C:\MyApps\TestServer\main.cpp:14:13: error: ISO C++ forbids initialization of member 'port'
[-fpermissive]
C:\MyApps\TestServer\main.cpp:14:13: error: making 'port' static [-fpermissive]
C:\MyApps\TestServer\main.cpp:14:13: error: ISO C++ forbids in-class initialization of non-const
static member 'port'
C:\MyApps\TestServer\main.cpp:16:2: error: expected unqualified-id before 'if'
C:\MyApps\TestServer\main.cpp:20:2: error: expected unqualified-id before 'if'
C:\MyApps\TestServer\main.cpp:72:1: error: expected '}' at end of input
C:\MyApps\TestServer\main.cpp:72:1: error: expected unqualified-id at end of input
TestServer: 1 file(s) built in (0:01.32), 1326 msec / file, duration = 1326 msec, parallelization 0%
```

There were errors. (0:01.38)

This is even after just a copy/paste of the server code from the Connection-Oriented Socket Tutorial.

Here is my code. Should I put the Socket code somewhere else beside the Top Window? Am I missing a #include?

```
#include <CtrlLib/CtrlLib.h>

using namespace Upp;

#define IMAGECLASS TestImg
#define IMAGEFILE <Test/images.iml>
#include <Draw/iml.h>

struct TheWindow : TopWindow
{
    MenuBar menu;
    Socket accept_socket, data_socket;
    int port = 2000;
    // Listen for connections using _accept_socket;
    if( !ServerSocket(accept_socket, port) ){
        throw Exc("Couldn't bind socket on the local port.");
    }
}
```

```

// You can do this in a loop to accept many connections:
if( accept_socket.IsOpen() ){
    dword ip_addr;
    // Hand off successful connection to _data_socket
    if( !accept_socket.IsError() && accept_socket.Accept(data_socket, &ip_addr) )
    {
        Cout() << "Connection from " << FormatIP(m_ipaddr) << "\n";
        // Read from the socket until it is closed, has an error, or you see an end-of-file marker
        // (EOF optional and application-specific)
        while(data_socket.IsOpen() && !data_socket.IsEof() && !data_socket.IsError())
        {
            Cout() << data_socket.Read();
        }
    }
    Cout() << "\n";
}

void Exit()
{
    if(PromptOKCancel("You really wish to exit?")) Break();
}

void SubMenu(Bar& bar)
{
    bar.Add("Exit", TestImg::exit, THISBACK(Exit));
}

void MainMenu(Bar& bar)
{
    bar.Add("Menu", THISBACK(SubMenu));
}

virtual void Paint(Draw& w)
{
    w.DrawRect(GetSize(), Black);
    w.DrawText(20,20,"Server is running", Arial(30), Green);
}

typedef TheWindow CLASSNAME;

TheWindow()
{
    Title("Test Server");
    AddFrame(menu);
    menu.Set(THISBACK(MainMenu));
}
};

```

```
GUI_APP_MAIN
{
  TheWindow app;
  app.SetRect(0,0,400,100);
  app.Run();
}
```

Indeed. You need to add Web package and #include "Web/Web.h".

Alternatively (and better), socket encapsulation was recently refactored into new TcpSocket class, which is part of Core (so you have it already included).

See [http://www.ultimatepp.org/src\\$Core\\$TcpSocket\\$en-us.html](http://www.ultimatepp.org/src$Core$TcpSocket$en-us.html)

Thanks for your response. I'm now trying to figure out how to use the TcpSocket class correctly. Looks like it's what I need, I just need to be a better programmer.

Ahhh! After messing with this for so long, I figured out I needed to download the latest nightly release for Socket or TcpSocket stuff to work! I was using version 4193 previously, which I believe was the latest "stable" release.

Is it standard practice for everyone to be using the latest nightly release? The one I grabbed was version 5021.

Hi Jonarmani,

A lot of improvements are generally implemented in the nightly builds. My way is to rename the installation directory of my current stable U++ version and install the latest build (ex. I rename Upp directory Upp-5010 for example and install the latest version ex. U++5021 in Upp).

So I can try the new build with minimal risk and can return easily to the previous stable version by renaming back the Upp-XXXX to Upp.

Regards

Biobytes

Ok, I really like that suggestion. Thank you.

Quote:Sets timeout for all operations. Zero means that all operations return immediately (in that case it is usually a good idea to perform some sort of external blocking on socket or socket group using e.g. SocketWaitEvent). Null means operations are blocking (but they still can invoke WhenProgress periodically if defined). Other values specify a number of milliseconds. Note: It is possible to adjust timeout before any single TcpSocket operation. Returns *this.

Thanks for the information. i really appreciate it a lot.
