All known SQLite problem - Sharing over network - may be solved by using one of network fork of SQLite:

<http://www.sqlite.org/cvstrac/wiki?p=SqliteNetwork>

Variant netSQLite have Public Domain license.

<http://atensoft.net/dev/sqlite3.php>

Perhaps, someone has worked with the product?

How it will be hard to connect this engine to U++?

Really need in-built engine that can work across a network.

Isn't easier to use Firebird instead? It is also small, but it is much more mature as a database.

What would be the SQLite of the network databases?. I mean, the simplest to install and administrate.

FirebirdSQL You can even use it without a server part, but in this case you are limited to one process.

Actually, Firebird is much better than SQLite. It is somewhat similar to MSSQL Server.

I use SQLITE because it's serveless and pain free. No messing with configurations and it's embedded in the final executable (thanks to static linking).

If a server solution is need it might be better to use Firebird, MySQL, whatever.

The reason for server-based Sqlite I think might be porting an existing BIG Sqlite database to work as a server.
