such as fly text, the text is moving on the window.

how to achieve it?

The only way I can think of to achieve this is
drawtext in ::Paint and change the text in other Timer callback,
has any idea?

Hello Akebee

Quote: The only way I can think of to achieve this is
drawtext in ::Paint and change the text in other Timer callback

For me it is the simplest way. However perhaps there is a softer way.

If you want *good* and 100% guaranteed unflickered animation you SHOULD bypass system GUI drawing. This means using OpenGL/DirectX.
OpenGL is more portable way and it is supported by U++.

i think i should still try timer callback
its simple

Hello Akebee

It is a good choose.

In addition to Mindtraveller advice, in Example/SDLExample and in Bazaar/SDLCtrl_demo you have nice examples of softly scrolling texts even with effects.

Yep, this is the simplest way, check examples/AnimatedHello.
