Hello,

I found a bug in all u++ applications, I have compiled on my GNU/Linux (Kubuntu 12.04 amd64). The problem is with all "fullscreen" application. When I moved my window to the additional display and I would like to make this window stretched to all screen surface. I can not do this. The window is marked as a resize to maximum but it not fit to screen surface.

I enclose picture with this error.

Sincerely,

Unable to reproduce. I have noticed some minor problems with multimonitor setup in Linux (namely initial theide splash-screen is centered across both windows), but maximize seems to work OK.

Tested with Linux Mint Mate 12 and Intel graphics.

i am currently setting up a linux mint box with upp ofcourse and noticed some problems here too, with single monitor though.. theide starts up with half of the size, but mouse thinks everything is allright, and receives commands at expected points as if maximized.

closing it and restarting gives a new sized theide, but still not the one needed. very seldom it sturts right.

couldn't figure out why..

so i'm currently stuck with win7, though i'd like to code in linux

Cinnamon?

I have experienced this bug, and unfortunately I am 98% confident it is Cinnamon bug. I do not even know how to provide a good workaround. I have filed it in Cinnamon bug tracker.

http://www.ultimatepp.org/forum/index.php?t=msg&goto=37127&&srch=cinnamon#msg_37127

One workaround that works is to add Sleep(1000) before maximize so that animation runs it course before maximize is issued, but that is just too plain ugly. Other than that, cinnamon WM gives no clue about when calling Maximize is safe (of course, it should be safe at all times anyway..).

Now running MATE and been happier than ever

Mirek

yea, it's cinnamon, damn it!!

gonna switch to MATE for upp sake...

Hello,

I have found solution for this bug. I have modified following file TopWinX11.cpp (CtrlCore):

```
void TopWindow::SyncSizeHints()
{
    GuiLock __;
    Size min = GetMinSize();
    Size max = GetMaxSize();
    if(!sizeable)
        min = max = GetRect().Size();
    Window w = GetWindow();
    if(w && (min != xminsize || max != xmaxsize)) {
        xminsize = min;
        xmaxsize = max;
        size_hints->min_width = min.cx;
        size_hints->min_height = min.cy;
        size_hints->max_width = max.cx;
        size_hints->max_height = max.cy;
        size_hints->flags = PMinSize; // <- THIS LINE
        XSetWMNormalHints(Xdisplay, w, size_hints);
    }
}
```

Instead of:

```
void TopWindow::SyncSizeHints()
```

```

{
    GuiLock __;
    Size min = GetMinSize();
    Size max = GetMaxSize();
    if(!sizeable)
        min = max = GetRect().Size();
    Window w = GetWindow();
    if(w && (min != xminsize || max != xmaxsize)) {
        xminsize = min;
        xmaxsize = max;
        size_hints->min_width = min.cx;
        size_hints->min_height = min.cy;
        size_hints->max_width = max.cx;
        size_hints->max_height = max.cy;
        size_hints->flags = PMinSize|PMaxSize;
        XSetWMNormalHints(Xdisplay, w, size_hints);
    }
}

```

Now it works great.

Sincerely,
Klugier

Any rational for this change? I am afraid that this would invalidate GetMaxSize purpose...

Hello,

I am sorry. It is my fault. But in meantime, I have found another better solution (I don't know it's good, but it works):

CtrlPos.cpp:

```
Size Ctrl::GetMaxSize() const
{
    return GetVirtualScreenArea().Size();
}
```

Instead of:

```
Size Ctrl::GetMaxSize() const
{
    return GetVirtualWorkArea().Size();
}
```

Sincerely,
Klugier

I don't know if this directly related as this is for just a single screen.

nneilson wrote on Sun, 08 July 2012 11:45 When TheIDE is opened or started the file and even the place in that file is saved for the next time it is opened.

Is there a way to have TheIDE open where it is not in the full screen mode?

That was back in July and it is still the same after many updates of u++
5494 always opens the IDE in full screen
The box that opens to pick the package can be moved and that is saved.

This is by design... (but I guess we can argued otherwise

OK, this sort of makes sense, but it looks like the real trouble is that we still do not deal with multiple screens correctly. We desperately need correct void Ctrl::GetWorkArea(Array<Rect>& out) implementation for Linux...
