Subject: using namespace Upp; causes errors

Hi!

Actually I only want to create labeled buttons with a custom background color. The only way to this seems to be chameleon, though I do not know whether this is something I have to install or just the example files that can be found here:

http://ultimatepp.org/redmine/projects/upp/repository/show/t ags/n-2011-15/reference/Chameleon

I downloaded and tried to compile, getting a load of errors. The first few being:

C:\eigene dateien\c-gefrickel\chameleon\main.cpp:3: error: expected namespace-name before ';' token
C:\eigene dateien\c-gefrickel\chameleon\main.cpp:3: error: `<type error>' is not a namespace

Also the simple helloworld project yields the same:

```
#include <CtrlLib/CtrlLib.h>

using namespace Upp;

GUI_APP_MAIN {
    PromptOK("Hello world");
}
```

Am I missing something here? Where is this Upp namespace supposed to be defined? (I ran a windows search for files containing "namespace Upp" in the uppsrc folder and found nothing)(I am using windows, by the way).

Thanks in advance!

Greetings,
 Mirko

In your main .cpp file under your #includes and any other namespace/s

using namespace std;
using namespace Upp;

Look at any of the examples, AFAIK they all have:

using namespace Upp;

Look through the examples as there might be one that does something similar to what your trying to do.

Look at the code for /reference/Chameleon to see what it has.

Do a search in the forum.
A google search "Upp buttons" might bring something up also.

This is where the namespace has to be used. I wanted to know where it is defined.

I think that this http://www.ultimatepp.org/forum/index.php?t=msg&goto=722 5& means that my version of U++ is a little outdated and has no namespace Upp yet. Thats because I followed this tutorial: http://www.codeproject.com/Articles/15163/Getting-Started-Wi th-Ultimate

I will update and test again.

Hi Mirko,

I believe that the one and only problem you had was that you installed only the Chameleon example, but not the other folders (judging by the paths). For U++ to work you have to have all the nests available (i.e. for reference examples the reference and uppsrc folders) or at least all used packages.

Best regards,
Honza
