
Subject: Why not drop ParentCtrl pane and add Ctrls directly to TabBarCtrl?

Is there a special reason for having a separate pane in TabBarCtrl? to group them? To only modify pane Rect on Layout()?

I modified my TabBarCtrl implementation and it seems to work..

i do SetRect(GetClientArea()) to all Ctrls in ctrls..

Am I forgetting sth?

The point behind it: make TabBar simpler in hierarchy, maybe even having manage adding/removing to/from ctrls in the ChildAdded() / ChildRemoved()?

EDIT: attached the patch file to show what i'm talking about

Well, it looks like you have replaced one line of code with about 15 lines. Does not look like a big improvement to me

well, your're right...

but it's also about structure...

it's a hierarchy level less in depth..

tabs are direct children and can be recurred without knowing about internal protected pane structure.. (that was the case that brought me to this change).

in my eyes it's an improvement, because straight forward, even though there are some more lines..
