Hello, I fixed some (loads of) language errors, added some missing translations and set the date format right in the Dutch translations.
Since I am running on a Dutch windows version I also took the liberty of changing the translation of standard buttons such as cancel and save to match the ones found in windows programs.

Here they are:

Great job Alboni, there were some weird translations in the latest stable release (5485) I wanted to fix but then I downloaded latest nightly (6240) and saw most of it was already done...

Now I did the latest missing translations and a few minor modifications.

One question though. I noticed that when testing with UWord with this translation, words like

What could be the reason for that?

Thanks

I just did a little test with UWord, but it looked correct on my pc, so I assume you're talking about your altered file. It is important that you use only UTF-8 as a character set when dealing with the

translations. If you edited the translations with anything other than Thelde there is a chance you're using a different character set which might garble anything non-ascii when used in Upp, even if it looks right in the external editor.

You caught some pretty daft mistakes there. Good work. We should merge my later version in.

One thing puzzles me: if I do an export with the latest upp, I'm not getting all those new strings that are in your file. Also can't import your file. Did you export AllFor18n?

I only worked with Thelde, exported from AllFor18n as prescribed and imported again. Then compiled UWord and noticed the strange things.
I think it happens at run-time because when I let UWord export the .tr all the texts in there are ok.

Ah well. Just tried on another machine with an unmodified 5990 release.

Like I did earlier, changed the SetLanguage in UWord from "LNG_ENGLISH" to "GetSystemLNG()"

This is what happened before. but now I had the bright idea to change SetLanguage to "LNG_('N', 'L', 'N', 'L')"

Now the translation turns out correct.

Is this a bug? maybe I should post this somewhere else.

I 'DUMPED' the following:
LNG_ENGLISH = 178867
GetSystemLNG() = 18297292
LNG_('N', 'L', 'N', 'L') = 471500

I am running Windows XP in dutch.

addition (after looking at GetSystemLNG()):
GetUserLocale(LOCALE_SISO639LANGNAME) = nl
GetUserLocale(LOCALE_SISO3166CTRYNAME) = NL
LNGFromText(GetUserLocale(LOCALE_SISO639LANGNAME) +
GetUserLocale(LOCALE_SISO3166CTRYNAME)) = 471500
GetUserLocale(LOCALE_IDEFAULTANSICODEPAGE) = 1252

Also Dutch XP here, and I have the same findings with `GetSystemLNG()`. I also tried it with my app and I get all the normal dutch stuff except the dutch version of Copy. But when using `LNGFromText("NL-NL")` or `"nl-NL"` all is well.

According to `GetSystemLNG()`, It has something to do with the codepage, when it's between 1250 and 1258 it does this:
`lang = SetLNGCharset(lang, CHARSET_WIN1250 + cs - 1250);`
which would create that weird number I posted above.
But what it means and/or if it is correct I don't know.
Maybe it is, and the stuff where the translations happens goes wrong. But I have not dived that deep yet.

It simply ***MUST*** be a bug in `GetSystemLNG()`, otherwise using `GetSystemLNG()` would have the same result as directly setting the language. The codepage stuff you found sounds like a good candidate to me.

I'm not sure about that.
I followed `t_()` to `t_GetLngString_()` (`Core/t.cpp`) and put in a few DUMP's. see attached screenshot (viewed with total commander).
It looks to me the translations are correct ("`r->text`" being translated UTF8 and "`text`" being the converted result).
But that would mean there's something wrong with putting the text on screen.

Well, maybe for another day. At least I learned a thing or two more about U++

Edit: oh, and looking at the screenshot. "justify" should translate as "uitvullen". "rechtvaardig" is straight from google translate I guess;)

Still looks like an encoding issue.

I didn't touch translations where I wasn't quite sure of the context. 'Rechtvaardig' is quite silly indeed.

Ow, could you apply this change? I'm using it in my programs and it works really well in dialogs.

"Null value not allowed.",
"Dit veld mag niet leeg zijn.";

[View Forum Message](#) <> [Reply to Message](#)

Well it seems indeed an encoding issue.

it seems, `t_()` returns a valid translated string in current encoding (codepage) but after that it still gets treated as UTF-8 which is wrong.

when I changed this in `UWord`:

```
//SetDefaultCharset(CHARSET_UTF8);  
SetDefaultCharset(GetLNGCharset(GetCurrentLanguage()));
```

(with `SetLanguage(GetSystemLNG())` still applied)

everything is normal again.

I don't know if this is the intended behaviour.

[View Forum Message](#) <> [Reply to Message](#)

And an updated translation... (against nightly 6243)

Please test it

edit: I had to add NL-NL manually to section `TabBar` before those translations would import.

It's been a while... noticed my name was still mentioned somewhere
So here some updated Dutch translations...

Enjoy
