Subject: SQL Syntax in PostgreSQL in U++

Hello,

I am wondering how to properly syntax SQL in U++.

Can someone post an example SELECT/INSERT query, maybe even let's say you have a string and you want to insert that string instead of typing it out in the query?

The example in the reference does SQL commands in a very strange way that I'm not used to.

Another example is an SQL statement where usually you would have "where" like 'SELECT something FROM somewhere WHERE width = 20' and such, as in the examples it seems to be going around the WHERE statement.

Thanks.

edit: I have figured it out since I posted this. Basically it's the same syntax as always, I don't know why the sample files had to intimidate me with their wacky unconventional syntax.
