Subject: Value::IsSame
Posted by mirek on Fri, 05 Apr 2013 16:30:29 GMT

ValueMap is ordered, which means that if keys are not in the same order, two ValueMaps are not equal even if all value for corresponding keys are. This is often the correct behavior, but sometimes unordered equality is needed - that is why new IsSame method of Value (it works recursively, going inside maps and arrays).
