Hey everyone,

Rather basic question here. I am trying to specify build options in the Package organiser. I can differentiate between compilers with MSC and GCC, for instance. But can I also specify the architecture somehow? By that I simply mean 32 / 64 bit, not ARM etc.

I would like to be able to say "add this library when you are compiling with Visual Studio 64 bit" and so on, however I browsed the code and didn't find such an option. Is it possible? Does anybody know how?

Thanks,

Kel

Builder name propagates as compilation flag (e.g. MSC8ARM). However, adding to RM, I guess it would be nice to have some more architecture flags (not bound to specific compiler version).
