---

```
class Frame : public WithFrameLayout<TopWindow> {  
    bool bValid;  
    ...  
  
    AbDlg dlg;  
}
```

Then in AbDlg, I want to ref bValid, how can i get it?

In my opinion, it would be like this:

```
void AbDlg::Func()  
{  
    Frame* p = GetParent();  
    bool b = p->bValid;  
}
```

Hello akebee

Interesting question.

In my case I would pass a pointer to class Frame in a AbDlg::Init() function or when opening it.
