I would like to thank the UPP developers for their efforts. I am a windows developer and would like to know:

Are there any plans to implement true XP Themes support?

What is the concensus on using native Win32 widgets?

Been thinking of using Qt. But I like your license better.

Thanks

As far as I know:

Development plan

Next release

U++ library

Chameleon technology (skins, improved OS specific look&feel)

Client-side draw (codename needed

more:

We cannot use native widgets because of RAD. Using existing interfaces would spoiled most of U++ effectivness. And they cannot be easily encapsulated as well.

Anyway, I agree this is a problem. What we can try is to emulate them to the point where differences are not noticeable and we are ready to do so (I believe, Swing does the same thing).

Actually, we plan to be more native than usual by detecting Gnome/KDE and adapting look by running environment/theme
