I tried the Controls4U\_demo project and it is very interesting in terms of iexplorer browser. I have tried to create my own project with the iexplorer browser control but without success (compilation errors).

Please, Is there any tutorial to teach me how to embed the iexplorer activex control in our projects? Which headers must I include?

Thanks a lot

Alex

Hello Alex

I think you have compiled successfully Controls4U\_demo but Internet Explorer control does not work in your project.

Controls4U\_demo is rather simple, so the first thing I would try in your case is just copying Controls4U\_demo Internet Explorer control in your project and seeing what happen.

In any case I advice you to post all your problems here, documenting them with code and compiler errors. Of course complete samples are acknowledged as they are simple to reply .

It is ok now Koldo...

Firstly I added lots of files and the generated errors were in a big number. Last try I added on by one file from Controls4U project and now it is working great.

One more question please, when we use the IE browser embedded in C# form, it is possible to call C code (project) from javascript code (javascript inside browser object). Is it possible too with your Control wrapper? If not, any tips to add that functionality?

Thanks a lot

Alex

Hello Alex

Yes, it seems possible to call C code from Javascript code. Please take a look at this post.
