Hello
I am trying to build an app to inspect all child controls of a main app window.
Firstly I tried FindWindow to locate main windows by class name and then use
EnumChildWindows to access all child windows of the main window. It works...

Then I used VS2012 Spy++ and the result is the same as EnumChildWindows...

Then I used the Ranorex and I see that Ranorex finds more child windows than
EnumChildWindows and Spy. In the link there is the scenario for skype window as an example
where we can see the differences, marked as red.

Please could you tell me why this difference?

Alex
