Similar to this post, we added some kind of Sqlld aliasing.

```
It works as follows: database.sch:
```

```
TABLE__(MyTableName, T1) // Fuer DBDomaenen INT_ (MPK) PRIMARY_KEY
BOOL__ (BooleanVariable, CB1)
INT__ (Nameld, CI1)
INT__ (Vendorld, CI2)
INT__ (Taskld, CI3)
STRING__ (Title, CS1, 255)
STRING__ (Description, CS2, 50)
TIME__ (Timestamp, CT1)
END_TABLE
```

will now generate the following Sqllds:

```
Sqlld MyTableName("T1");
Sqlld MPK("MPK");
Sqlld BooleanVariable("CB1");
Sqlld Nameld("CI1");
Sqlld Vendorld("CI2);
Sqlld Taskld("CI3");
Sqlld Title("CS1");
Sqlld Description("CS2");
Sqlld Timestamp("CT1");
```

Well, as you see, aliasing is not the correct terminology, maybe some kind of simple database column name obfuscation.

Patch attached to this post; done against r6693 but also works against r6870.

Something to be included in TRUNK?

This is interesting idea, but has disadvantage that it needs a fix to all "driver" schema definition headers. I will have to think about it a bit before committing to trunk.
