Hello,

I have a SqlArray and it is properly filled with the data coming from a sqlite DB. Now I run some code like this

```
   String f = LoadFile("qualificati_c16.csv");
   Vector<String> records = Split(f, "\n");
   SQL.Execute("DELETE FROM qualificati");
   for (i=0; i<records.GetCount(); i++) {
       Vector<String> r = Split( records[i], ";", false);
     if (r.GetCount()>3) SQL.Execute("INSERT INTO qualificati
(id_fsi,nome,data,idcircolo,siglaprov,siglareg,sesso) VALUES(?,?,?,?,?,?,?)",
r[0],r[1],r[2],r[3],r[4],r[5],r[6].Mid(0,1));
   }
```

and change the content of the database.
Unfortunately the SqlArray does not know that the DB is changed and continue to show old data already gone.
I guess there should be some smart way to tell SqlArray to read again the database and show its new content.

I tried Update() but no success, perhaps it is intended for something else.

Thanks,
Luigi

The most straightforward is ReQuery.
