Hi,

First of all, thanks for the fix to the previous problem! Here's another one: Thelde crashes in the following case.

Make a new GUI application and use the layout editor. Place any widget (e.g. a button) to your layout. Then change the widget to another using the scroll down menu in the left window (see attached picture).

Now try to change the widget again and Thelde crashes.

U++602/Fedora4/Gnome

Akos
