Hi all,

There is such class as Clock. I got error using it in a very simple application which has window and a single control of Clock class in it. When I tracked down what is going on it showed up that member variable hs is not initialized. It is set up in Clock::ComputeSize() so somehow this function was not called anywhere. I fixed the problem by adding relevant code computing hs to Clock::CalcSizes(), but I don't know whether this is a good way of solving it.
