Excuse me.

How to do something like this: |Login | \*\*\*\*\* | Description|?

I have a three column GridCtrl and the second column (password) should be hidden (masked by '\*').

When user double clicks on password cell (GridCtrl: EditMode=Cell and Editing) the data from cell must be displayed as original string without '\*'.

Dmitry.

Hello r-krat

I suppose I would do this:

In the class defiition:

```
EditString editPassword;
```

In the class initialization:

```
editFile.Password(true);  
grid.AddColumn("Password", 70).Edit(editPassword);
```
