When doubleclicking identifier or searching for identifier, ide now highlights all matching identifiers in the file.

Hello Mirek,

Identifier highlighting is really cool feature, but in current implementation it has some drawbacks. First of all it should also work with selection callback (WhenSel). Example (ide/idewin.cpp - line 309):

```
editor.WhenSel = THISBACK(SetToolBar); // <- This callback should also operate "Identifier highlighting".
```

The second issue is that it doesn't work correctly in some cases. Example:

In this example "turn" substring inside "return" shouldn't be highlighted.

Sincerely,  
Klugier

First issue: I was considering that option too, for the moment decided against it. One reason is that it would require full screen repaints while selecting.

Second issue: Yes, I guess you are right. Will fix.

OK, I have tested with CodeBlocks which seems reasonable logic, will fix both issues accordingly...

Hello Mirek,

Thank You! It works perfect!

Sincerely,  
Klugier
