Hi,

How do I get a window element size, e.g. title bar height, V scrollbar width? Preferably before I create the window.

Thanks.

Please note that U++ is responsible for the window inner contents. The decorations around the window are a subject to control by window manager (U++ has limited set of routines to control it). I'm afraid there's no portable (window manager - agnostic) way of detecting decoration parameters, that is why U++ doesn't contain methods for detecting them. So please consult documentation on window manager you use (WinAPI, Gnome, etc.).

Here's a (ugly) workaround that will give you some values:

...

int WFrameWidth, TitleBarHeight;

```
void Get_WFW_TBH()
{
    TopWindow w,w1;
    w.SetRect(10,10,10,10);
    w.OpenMain();
    w1.SetRect(w.GetRect());
    w1.OpenMain();
    Rect rw=w.GetRect();
    Rect rw1=w1.GetRect();
    WFrameWidth=rw1.left-rw.left; //left-frame thickness
    TitleBarHeight=rw1.top-rw.top;
    w.Close();
    w1.Close();
}
```

I use it on Linux to get retain exact positioning of topwindows between sessions.
There's a quick flash of the two windows (easily not noticed ;)
Don't know how portable (should be OK)
(MSWindows has built-in functions to get those values, I think, but the code should work even there)
