hi-

My UPP is installed for uppsrc to something like:

/usr/share/upp/uppsrc.

I can't seem to get the system to let me specify #include <Firebird/Firefbird.h>

It wants something like <usr/share/upp/uppsrc/Firebird/Firebird.h>

Oh...I moved firebird from the bazaar to uppsrc. If I don't do that, I can't select
any bazaar files in the package organizer.

I used to have my uppsrc in my home directory somewhere and it seemed to work better.
I am not sure where I am going wrong with the IDE tonight. I can't seem to find the place
in the IDE to set what I would call a "source directory" path.

thanks for any assistance,
mtdew3q

Hi-

Sorry about that.

I kept thinking surely I can adjust something and get it to work.
I did a reinstall and in like 5 to 10 minutes was up and running.

Not sure what went wrong.

Oh well...

thanks
