Subject: Add export project to post-link steps

Currently post-link steps are organized in rather strange way. I really don't understand why not to add a pair of simple edit controls into Custom build steps dialog. For example, left control lists pre-compile actions, while right control lists post-link actions.

But this is just a rhetoric question.

At least we could add drop down box to the right column which adds predefined values: post-link, etc...

But what I really want to ask is to be able to call Project export as a custom build step.

Delivering sources to [pre-]production server is currently rather common task. Of course, unix-based OS without TheIDE needs exported project. It will be very convenient if it will be possible to automatically export & sync updated sources to server. All we need here is ability to export project (a 'Used' button equivalent) to a directory.

P.S. Talking about exporting project from TheIDE, I've met strange behavior: debug/release mode of exported project is not dependant on Output mode combo box selection Debug/Release.

Instead it is dependant on current selection of configuration in toolbar of IDE itself (I mean drop list with values like like MSC10 Debug or GCC Optimal).
